Institutions and Relational Taxation in the Oil and Gas Industry

Radoslaw Stefanski University of St. Andrews Gerhard Toews NES and OxCarre Marta Troya Martinez NES and CEPR

HSE, 20th February 2020

- Rules (e.g. constitutions, laws and regulations) that limit individuals' ability (including the state) to manipulate outcomes to their advantage
- Well-functioning institutions, at least, protect property rights and enforce private contracts
- Are a key ingredient for investment, and hence, economic growth and development (Acemoglu, Johnson and Robinson, 2005)

Informal institutions

If formal institutions are weak... informal institutions can emerge:

- Hired professional protection of property rights (Gambetta, 1993)
- Networks of information transmission, social norms or punishments (Milgrom, North and Weingast, 1990, Greif, 1993)
- Relational contracts (Antras and Foley, 2015, Macchiavello and Morjaria, 2015, Gil et. al. 2017)
 - Are informal agreements sustained by the value of future relationships (Malcomson, 2012)
 - \clubsuit Future rents are needed to deter short-term opportunism \Rightarrow incentive constraint

- All the previous examples involve contracting between private parties
- What if the contracting party is the government itself?
- To study if relationships with the government can overcome enforcement problems, we need an environment where:
 - Firms make ongoing specific investments in the country
 - It is difficult to enforce contracts

Introduction Theory Data Results Back to theory Results 00000 The oil & gas industry

It is a great setting because:

- It is *the* capital intensive sector ⇒ 3.3 bill. US\$ per worker during construction ⇒ next in line is manufacturing (chemicals) 0.1 bill. US\$ per worker (Heiner, 2009)
- Some oil producing countries have very weak institutions
- Moreover, property rights of oil are with the state
- Opportunism is particularly severe
- Weak institutions slow down private investment (Bohn and Deacon, 2000 and Cust and Harding, 2019)

 This paper

- Contracts of the major oil & gas companies worldwide for 1975-2013
- With relational contracts, elections weakens the government's credibility (i.e. reduced discount factor)⇒ the incentive constraint tightens ⇒ government increases current taxes to reduce the temptation
- Findings:
 - Only governments in countries with weak institutions seem to face a tight incentive constraint
 - Taxes in those countries increase by 8pp on the year of election
 - Investment and taxation in those countries are relatively more back-loaded as theory predicts

Relational contracts:

- Empirical literature shows that relational contracts are important between and within firms: McMillan and Woodruff (1999), Antras and Foley (2015), Macchiavello and Morjaria (2015), Gibbons and Henderson (2013),etc.
- We have: (1) one side is the government, (2) show evidence of contract backloading

Resource economics:

- Institutions affect investment (Cust and Harding (2019)), insurance provision to the government (Stroebel and Van Benthem (2013)) and expropriation (Guriev et.al. (2011))
- We show in which way institutions shape the agreements

Self-enforcing agreement

- The government promises need to be credible
- If government collects different *GT_t* from agreed ⇒ Firm stops investing ever after ⇒ Government expropriates firm:

$$(1-\delta)GT_t + \delta \mathbb{E}[V_{t+1}] \ge (1-\delta)r(I_t; p_t)$$

 Incentive constraint ⇒ government's future value is larger than the current gain from not honoring the agreement

 00000

Countries with Weak Institutions

Governments can expropriate ⇒ Government's incentive constraint binding:

$$(1-\delta)GT_t + \delta \mathbb{E}[V_{t+1}] = (1-\delta)r(I_t; p_t)$$

- Elections: government may lose power \Rightarrow effective discount factor $\downarrow \delta \Rightarrow$ incentive constraint tightens
- The agreed *GT_t* on the year of election is larger to prevent the government from expropriating

Conclusion

Countries with Strong Institutions

Governments cannot expropriate ⇒ Government's self-enforcing constraint is never binding:

$$(1-\delta)GT_t + \delta \mathbb{E}\left[V_{t+1}\right] > 0$$

- Elections: the incentive constraint is still slack
- GT_t should not change on the year of election

Data: Oil and Gas contracts

Data

0000

Theory

 Proprietary data on 24 private and public gas & oil firms (Source: BP, Wood Mackenzie)

Back to theory

Results

Conclusion

- List from Ross (2012) based on stock & resources value
- For each firm *f*, country *i* and year *t*, we have the realized agreements worldwide for 1975-2013 ⇒ 6218 observations, 274 firm-country combinations and 60 countries
- Present values using S&P 500 Index returns incl. dividends
 ⇒ alternative measures: no discounting, real values using
 US CPI and normalizing by GDP

Theory

 $\Delta \ln(\mathsf{GT}_{ift\tau}) = \theta \Delta \ln(\mathsf{Rev}_{ift\tau}) + \alpha \mathsf{Inst}_{it} + \beta \mathsf{Elec}_{it} + \gamma \mathsf{Inst}_{it} \times \mathsf{Elec}_{it} + e_{ift\tau}$

Back to theory

Results

Conclusion

Results

00000000

- $GT_{ift\tau}$ is country's *i* government take from firm *f* in year *t* at period τ of their relationship, $Rev_{ift\tau}$ are revenues similarly defined, Inst is quality of institutions in country *i* at year *t*, Elec is a dummy with the year of an election in country *i* and $e_{ift\tau}$ is the error term
- Expect:

(1) $\alpha\approx$ 0 because account for constant unobservables (2) $\beta>$ 0 and $\gamma<$ 0 since lnst increases with the quality of institutions

Conclusion

year

Countries with weak institutions: heterogeneity effects

0000000000

Results

• When does the government take change?

Theory

• Is the increase associated with regular elections (i.e. preestablished by the political cycle) or with unexpected ones?

Back to theory

- The value of expropriating is larger if the there is a large national oil firm ⇒ government's incentive constraint is tighter ⇒ Is the increase in the government take larger in this case?
- Is the trust-based relationship with the government firm specific? We look at how the increase in government take is allocated between firms that have been in the country for more than 15 years and those that have not

Conclusion

Introduction Theory Data Results Back to theory Results Conclusion

Heterogeneity effects

We use the following specification:

 $\Delta ln(\mathsf{GT}_{ift\tau}) = \theta \Delta ln(\mathsf{Rev}_{ift\tau}) + X + \mu_t + \omega_\tau + \lambda_{ft} + \eta_{if} + \varepsilon_{ift\tau}$

- Timing in the change of GT: $X = \sum_{k=-1}^{1} \alpha_k \text{Elec}_{it+k}$
- Expected vs unexpected: $X = \alpha_1 \text{Elec}_{itexp} + \alpha_2 \text{Elec}_{itunexp}$
- Large national oil firm: $X = \alpha_1 \text{Elec}_{itoil} + \alpha_2 \text{Elec}_{itnooil}$
- Early and late entrants: $X = \alpha_1 \text{Elec}_{itf \ge 15 \text{years}} + \alpha_2 \text{Elec}_{itf < 15 \text{years}}$

Investment and taxation dynamics

Countries with weak institutions

Theory

• Only governments in countries with weak institutions face a binding incentive constraint

Back to theory

0000

- Thomas and Worrall (1994) show that a firm that maximizes initial profits should "back-load" the agreement
- Firm increases the government's value over time by gradually: (1) increasing investment, and (2) increasing government take
- Why? By pushing the government's gains towards later parts of the relationship, firm's threat to terminate the relationship becomes more effective ⇒ government's commitment improves!

Countries with strong institutions

- Governments in countries with strong institutions do not seem to face a binding incentive constraint
- Thomas and Worrall (1994) show that the firm should undertake the "first best" investment every period \Rightarrow However, in the oil & gas industry it is efficient to front-load investment
- The timing of the government take is undetermined

Real government take and real investment over the period τ of their relationship.

Real government take and real investment over the period τ of their relationship.

Which agreements are backloaded?

- Take full sample again
- We estimate this specification for government take:

 $\Delta ln(\mathsf{GT}_{ift\tau}) = \theta \Delta ln(\mathsf{Rev}_{ift\tau}) + \mu_t + \omega_\tau + \eta_{if} + \varepsilon_{ift\tau}$

• We estimate this specification for investment:

$$\Delta ln(\mathsf{Inv}_{ift\tau}) = \mu_t + \omega_\tau + \eta_{if} + \varepsilon_{ift\tau}$$

• η_{if} represents the country-firm departure from the average growth \Rightarrow we plot it against the country's average quality of institutions

Government take over time

Timing of government take

Average growth in real government take (conditional on year FE, period FEs and logged real revenue) and the average executive constraint.

Timing of investment

Average growth in real investments (conditional on year and period FE) and the average executive constraint.

- The quality of institutions is associated with the government's credibility when contracting with oil and gas firms
- Governments in countries with weak institutions increase the change in government take by 8pp on the year of the election
- This increase in more prominent when there is a successful oil company from this country and is mostly paid by late entrants
- Firms respond to the lack of credibility by backloading investment and the payment of government take

- New theory? A good identification?
- Collecting the data about winners of elections ⇒ How is the government take affected when the incumbent wins the election?
- Collecting data on off-shore drilling \Rightarrow harder to expropriate than on-shore
- Collecting data on giant discoveries (≈ shock to profitability) ⇒ How does this affect the agreements?

(1) reproduces previous results, (2) accounts for the fixed effect by accounting for averages, (3) uses CPI,
 (4) uses nominal values, (6) divides by GDP. Standard errors in parenthesis clustered by country and year,

and * stands for statistical significance at the 10% level, ** at the 5% level and *** at the 1% percent level.
